Once you have a NIC installed in your computer you need to configure your OS to connect to the network. Follow the instructions below for Macs with system 7.5.5 or higher. Older versions of Mac OS need to be brought to the Help Desk for configuration.

1. Click the **Apple** menu, select **Control Panels**, then **AppleTalk**.

2. From the **Connect via** drop down list select 'Ethernet', note the zone and close the window.

3. Click the **Apple** menu again and select **Control Panels**, then **TCP/IP**.
4. Click the **Edit** menu and select **User Mode**.
5. In the **User Mode** menu select 'Basic' and click OK.
6. In the **TCP/IP** window select 'Ethernet' from the **Connect via** drop-down.
7. Select 'Using DHCP Server' from the **Configure** drop-down.
8. Close the **TCP/IP** window and save when prompted.

If these steps don't work for your hardware or if you need further assistance, bring your computer to the Help Desk or call x2077. An appointment can be arranged with a technician to set up your computer in your room if you cannot get it to the Help Desk.
